

# About My Learning Website

This website is designed to teach the basics and advanced concepts of HTML. Starting with headings and paragraphs, we gradually move into more complex topics.

**HTML lists** are essential for organizing content. We have covered *ordered lists*, *unordered lists*, and *definition lists* to create well-structured information.

Understanding **image paths** is crucial. We have explored relative paths for local files and absolute paths for external resources. This knowledge is key for web development.

## Text Formatting

HTML provides various tags to format text, like **bold**, *italic*, and <sup>superscript</sup>. Use these to make your content engaging.

We also explored how to add ~~removed text~~ and inserted text, giving us flexibility in how we present information. Using the **style attribute**, we can easily change text color and background color.
